Why Choose Solution Dyed Acrylic?

When acrylic fabrics are manufactured, they start their life in a liquid form made from various polymers. This liquid is then put into a machine called a spinneret where the liquid is forced through tiny holes, long thin fibres are extruded which are then woven into fabric. In 100% solution dyed acrylic fabrics, the dye is added at the liquid polymer stage before the yarns are extruded, meaning it becomes part of the fabric make-up, as opposed to 100% yarn dye where the dye is added after the spinneret stage and does not penetrate the inner fibres.

This all means that with 100% solution dyed acrylic fabrics, you will have a fabric that will keep its colour, handle heavy use, and stand up to the elements, especially in marine environments.
