

PCS 12/24V - CONTROL PANEL FOR ELECTRONIC PUMPS

£63.48

Excl. Tax: £52.90

Product Images

Short Description

The control panel for electronic pumps allows to remotely monitor the operation of the pump and interact with it. It is in fact possible to see when the pump is on and if there is still liquid to be transferred. Additionally, if the pump stops operating due to running out of liquid or due to an overload, you can reset the alarm and restart the system without having to turn off the power. Finally, you can turn off and on the pump

with the simple push of a button. The panel can be mounted or recessed in a circular hole with a 70mm diameter, or can be surface mounted using the provided square box with two screws. To operate simply connect the pump with the 3m cable supplied or another 4-wire phone cord and double-ended RJ11 / 6. In the back there is a terminal block that allows you to replicate the buttons and LEDs of the panel on an external circuit: this allows you to individually control the features on the dashboard or in a device designed by third parties. The PCS can be bought separately but is also included with many of the "Electronic Brain" water systems.

Additional Information

Input Voltage	12 / 24Vdc
Liquid Type	Fresh water
Power Consumption	3 Amps
Weight (kg)	0.240000
Manufacturer	Marco
